IMMEDIATE CONSTITUENT ANALYSIS

IC Analysis

- Structuralist tool for syntactic analysis
- Introduced by Bloomfield followed by Roulon Wells and Zelling Harris
- Analysing each utterance into the smallest meaningful units possible.
- Units at the last level are called *ultimate constituents*
- *Constituents* --- any word or morpheme or construction which enters into some larger construction
- *Construction* ----any group of words or morphemes or a phrase or sentence

- Each construction is broken up into successive layers
- At each stage of division, the two constituents are called the *immediate constituents* or *ICs* of that particular construction.

Ways of showing the IC

Box Diagram

The boy

eat s

the mango es

Brackets diagram

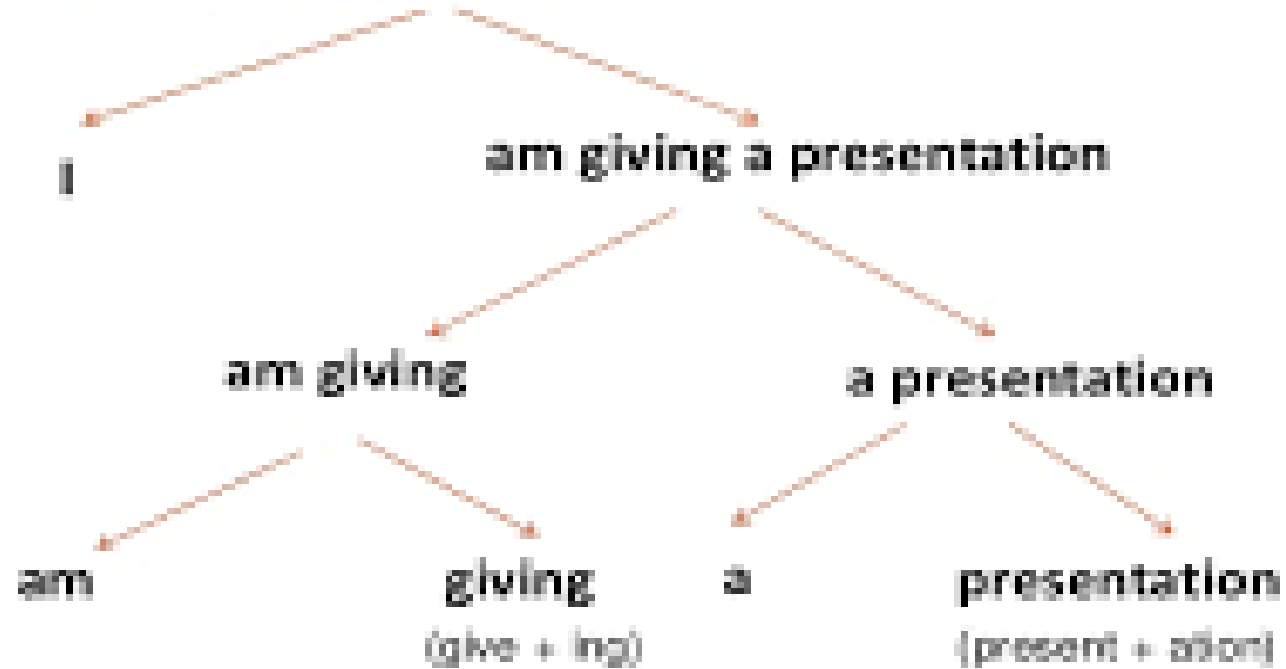

[[The] [boy]] [[eat] [s] [the] [mango] [es]]

Tree Diagram

EXAMPLE:

I am giving a presentation

Limitation

- Constructional homonymy or the problem of ambiguity

E.G. hunting dogs and small children's pets

Ambiguity ---- lexical, constructional and derivational

bank , old men and women , love of god

Structural homonymy--- constructional and derivational ambiguity

- Problem of discontinuity or discontinuous Ics

E.G. Is he coming?

He took his hat off

Limitation

- Problem of embedding

E.g. The boy who won the prize is my cousin.

- Problem of conjoining

E.g. Do you like beer, brandy or rum?

- Problem of inter-sentence relationship

E.g. I teach grammar. Grammar is taught by me.

- Problem of overlapping

E.g. He has no love of or kindness for dogs.

Limitation

- The problem of structural similarity an different grammatical relation among constituents.

E.g. John is easy to please and John is eager to please

- The problem of multiple ICs

E.g. An intelligent, smart, sprightly boy.....

- Problem of understood elements

E.g. pass the salt

Thank you
