# TWISTING COUPLE on a cylinder 

LALY A.S.

ASST. PROFESSOR
DEPT. OF PHYSICS
LITLE FLOWER COLLEGE, GURUVAYUR

Consider a cylindrical rod of length 'L' and Radius 'r'.

Its upper end is clamped and the rod is twisted by applying a couple to its lower end.

Due to the elasticity of the material , a restoring couple is set up to oppose the twisting couple.

At equilibrium the two couples balance each other.

Let us imagine the cylinder consists of large no. of thin coaxial cylindrical shells.
Consider one such shell of radius $x$ and thickness dx and length L .

As the rod is twisted , a line $A B$ on the surface of the cylindrical shell takes up the position $A B^{\prime}$ through an angle $\mathrm{BCB}^{\prime}=\theta$

The angle ' $\varphi$ ' is the angle of shear.
$B^{\prime}=x \theta=\mathrm{L} \varphi \quad$ or $\quad \varphi=\mathrm{x} \theta / \mathrm{L}$
$\varphi$ is maximum at the rim and zero at the axis

We have Rigidity modulus,
$n=\frac{\text { shearing stress }}{\text { shearing strain }}=\frac{T}{\phi}$
$T=n \phi=\frac{n x \theta}{L}$
Area of cross section of the shell $=2 \pi x d x$
Shearing force of the shell $=T \times$ area of cross $\sec$ tion
$F=\frac{n x \theta}{L} 2 \pi x d x=\frac{2 \pi n \theta}{L} x^{2} d x$

Moment of this force about the axis $\mathrm{OC}=$ Force $\times$ Perpendicular distance

$$
=\frac{2 \pi n \theta}{L} x^{2} d x x=\frac{2 \pi n \theta}{L} x^{3} d x
$$

Total twisting couple for the whole cylinder, $\tau$

$$
\tau=\int_{0}^{r} \frac{2 \pi n \theta x^{3} d x}{L}=\left[\begin{array}{cc}
\frac{2 \pi n \theta}{L} & x^{4} \\
4
\end{array}\right]_{0}^{r}=\frac{\pi n r^{4}}{2 L} \theta
$$

Let couple per unit twist be $C$ and $\theta$ be the angle of twist,
The twisting couple $\tau=\mathrm{C} \theta$
So,

$$
C=\frac{\pi n r^{4}}{2 L}
$$

C is the couple per unit twist, n rigidity modulus of the material of cylinder, r radius of cylinder,L length of the cylinder

## Workdone in twisting a wire through an angle $\theta$

If " $c$ " is the couple pe unit twist, then the couple required to twist the wire through an angle $\theta$ is $c \theta$.

Then the work done in twisting further through a small angle $\mathrm{d} \theta$ is
$\mathrm{dw}=\mathrm{c} \theta \mathrm{d} \theta$
Hence the total work done in twisting a wire through an angle $\theta$

$$
w=\int_{0}^{\theta} c \theta d \theta=\frac{1}{2} c \theta^{2}
$$

$\mathrm{w}=1 / 2 \mathrm{c} \theta^{2}$

Calculate the work done in twisting a steel wire of radius $10^{-3} \mathrm{~m}$ and length 0.25 m through an angle of $45^{\circ}$. Given the rigidity modulus of the wire is $8 \times 10^{10} \mathrm{~N} / \mathrm{m}^{2}$.
$\mathrm{W}=1 / 2 \mathrm{c} \theta^{2}, \quad C=\frac{\pi n r^{4}}{2 L}$
$\mathrm{r}=10^{-3} \mathrm{~m}, \quad \mathrm{~L}=0.25 \mathrm{~m}, \quad \theta=450=\pi / 4$ radian $\mathrm{n}=8 \times 10^{10} \mathrm{~N} / \mathrm{m}^{2}$

$$
w=.1547 \mathrm{~J}
$$

## THANK YOU....
